

Navigating closed spaces could be impossible for those visually impaired

Many solutions to this issue require another non-impaired person, or a white cane which offers little context for what the user has come in contact with.

You may have heard of BeMyEyes, an accessibility technology for low-vision people that pairs them with a volunteer who helps them navigate a room

Our app allows users to know what is around them at all times, even giving emergency alerts in the event something is in harm's way and providing alert customizability, all without the help of someone else

Introducing Luminate

We can alert you of the x closest objects every y seconds.

Luminate offers users context to their surroundings, reading out objects, their distance, and relative bearings to the user.

For example: "Table, 1.5 meters, 30 degrees to the left"

Whenever something comes within half a meter, we've got you

Luminate features an emergency alert system using haptic feedback when an object gets too close. This will disrupt anything going on and instantly give you a heads up.

Personalization

It's entirely up to you! Users can also choose from 3 Google Text-to-Speech Voices as well as set the number of objects detected from 1-10, as well as the amount of seconds in between detections from 1-10.
